PMPD 1000

The PMPD 1000 dilution system is according to the ejector principle specially developed for the PMP application or the PMP measurement chain. In the PMPD 1000, volatile particles are evaporated up to 200 °C using a thermodiluter. A dilution factor 1:1000 (see Figure 1) is achieved by cascading 3 x dilution factor 10.

OPERATION PRINCIPLE

DILUTION SYSTEM EJECTOR WITH DILUTION FACTOR 1:1000

Fig. 1: PMPD 1000

The PMPD dilution systems offer all the advantages of the other Palas[®] product series of ejector diluters, e.g., a temporally constant dilution factor.

The suitability of the PMPD 100 for the PMP measurement chain was confirmed at the METAS Institute in Switzerland (see measurement report no. 235-10383). The PMPD 1000 cascades a further dilution step as compared with PMPD 100.

VDI report no. 1973 from 2007 proved metrologically that a reproducible aerosol dilution is possible with the Palas® dilution systems down to V_F 100,000.

BENEFITS

- The dilution systems from Palas® are clearly characterized. This is proven by means of a calibration certificate for each individual device
- The dilution steps of the PMPD series produce a temporally constant, representative dilution with factor 100 / 1000
- Low compressed air consumption (e.g. only 96 L/min. for a dilution factor of 1000 with four VKL 10 systems)
- The dilution steps can be combined with all common particle counters
